Abstract

A cannula system includes a nasal cannula coupled between a pair of extension tubes secured within a corresponding pair of ear pieces, each ear piece having a recessed channel for receiving one of the extension tubes to help facilitate adjusting the distance between the nasal cannula and the ear piece to position the nasal cannula relative to the nostrils of a user. One of the extension tubes has its distal end plugged with a stop, while the other extension tube has its distal end coupled to a fluid source. The method of using the cannula system for delivering fluid to a user includes supporting the nasal cannula between the pair of extension tubes slidably secured within the corresponding pair of ear pieces and placing a stop at a distal end of one of the extension tubes and coupling the distal end of the other extension tube to a fluid source.
